

Site Name: idahoweather.org

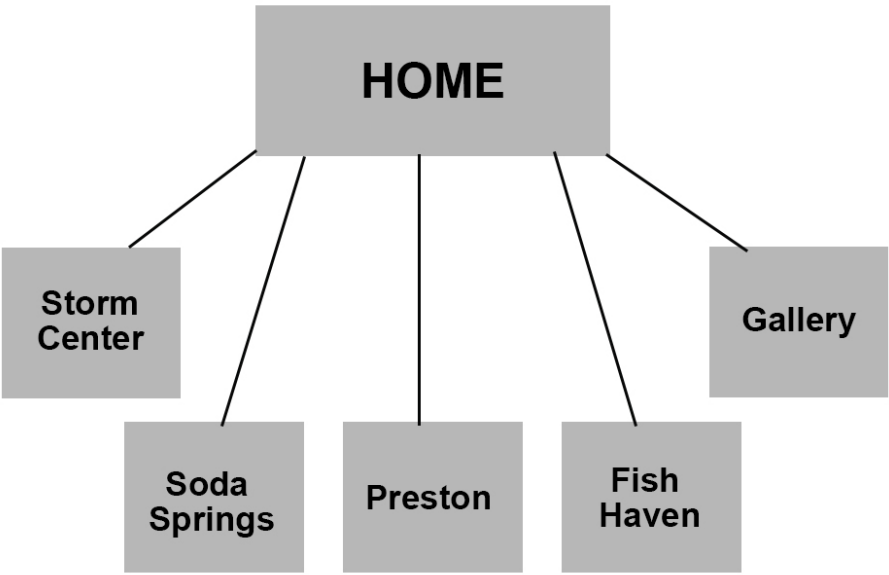

Site Purpose:

The purpose of the site is to inform people in the Southeastern Idaho region about the weather and weather or environmental related content. The goals of this website should be providing accurate weather information quickly. The site should also aspire to provide more information than most other weather sites. Other types of content that could also be added to the site is breaking news related to weather conditions and environmental news.

Target Audience and Scenarios

There are many types of people who would want to visit the weather sites, most being people who enjoy outdoor activities. One type of user might be a younger, athletic person who wants to check the weather to see when they can go outside later that day. Another type of person could be an older person with a family who wants to do outdoor things like hunting, fishing, and camping. To appeal to these two personas we could put related content on the site to these topics so that these people would be more interested. There could also be a third type of situation in which someone needs to quickly find out the weather because of a natural disaster or weather event, so in that scenario you would need the site load quickly and be quickly accessible.

Idaho Falls Water Conservation

Water is Idaho's most valuable natural resource. You can make a big impact on water conservation by doing a lot of little things. Things like turning the water off while you brush your teeth, fixing small leaks in your faucets, or changing out old and inefficient fixtures. Looking for little things around the house can have big impact on the environment.
